MindTree's SaaS Application Platform

The SaaS Application Platform is a set of enablement accelerators which provide low cost of entry solution for "SaaS-ifying" a traditional web application. Cost reduction is provided in terms of reduced time, knowledge skills and experience required to build a mature SaaS application optimized to run on the cloud. These accelerators provide pre-hardened (pre-tested) components as a framework, which require a little "glue" code for binding these components to an ISV's application.

These components viz.; Billing, Metering, Tenant Portal, Service Bundling and Selection Agent, etc. are the basic SaaS components required by any application to be transformed into a true SaaS application, which usually take considerable time to build and mature. By opting for these accelerators any ISV can cut down their time to market significantly, considerable enough in today's highly competitive, short cycle market.
